

Post / Blog Service

Community content | Structure & dependencies | new proposal

Purpose and ownership

Owns registered-user community blog drafts, moderation, approved public snapshots and revisions. It is separate from curated Notes and has its own datastore.

Dependencies

Java 21; Maven Wrapper; pinned Spring Boot/Cloud; Web MVC; Spring Data MongoDB (proposed); OAuth2 Resource Server; Validation; Actuator; OpenAPI; JUnit + Testcontainers. Own Mongo database and replica set for atomic publication.

Proposed package / class map

PACKAGE	CLASSES AND RESPONSIBILITY
config / security	MongoConfig, SecurityConfig, JwtClaimsConverter - own DB and issuer validation
post/controller + dto	PostController; CreatePostRequest, PatchPostRequest, PostResponse, PostCardResponse
post/service + repository	PostService, PostRepository, PostDocument - owner-filtered draft lifecycle
review	PostReviewController, PostReviewService, ReviewPostRequest, PostReviewAudit - moderation
revision / publication	PostRevisionDocument, PostRevisionRepository, PublicationService - immutable approved snapshot
publicapi	PublicPostController, PublishedPostResponse - public approved cards and detail
common/error	ApiExceptionHandler, ApiErrorResponse, PageResponse - paging and errors

Service links

React -> Gateway -> Blog -> own MongoDB; User/OAuth JWKS validates author identity. Optional Notes public taxonomy lookup through API. Search/Media integrate only in later phases.

Build order

Baseline -> own draft CRUD -> submit/reject/publish with reviewer audit -> public feed -> UI editor/queue -> search/media later.

Implementation note

Routes, scopes, database choice, port and repo are proposed. Do not put BLOG in Notes M1 or share its collections. Approved community posts are public at launch.
